

EVENup

Shoe Lift

Without EVENup

With EVENup

While wearing an orthosis, you may notice a slight difference in height when comparing the healthy leg in a shoe to that of the injured leg. This means your pelvis is in a tilted position, this can lead to pain in the back, hips and the knees.

Wearing the EVENup can balance your posture and help to prevent these issues.

- can help reduce hip, shoulder and knee pain
- may reduce the need for physical therapy to correct pain in shoulder, neck or hip by wearing an orthosis
- helps improve gait and allows for a more natural walk
- fits right or left foot
- offers three height adjustments: 1,5 cm and 1,9 cm and 2,8 cm lift

Size	Small	Medium	Large
EUR	34 - 38	39 - 43	44 - 46
